

ADDITIONS TO THE HETEROPTERA-FAUNA OF THE CANARY ISLANDS 11

By E. HEISS* & J. H. WOUDESTRA**

With 6 figures

ABSTRACT: As an addition to previous papers (HEISS & BAEZ, 1990; HEISS & KIBES, 1992) 4 new records for the Canary Archipelago are given, bringing the total number of so far known Heteroptera to 335 species. Furthermore 64 new island records and several additional localities for already reported species are listed.

Key words: Heteroptera, Canary islands, new records.

RESUMO Como adição a publicações previas (HEISS & EAEZ, 1990; HEISS & RIBES, 1992) são dados 4 novos registos para o Arquipélago das Ilhas Canárias, elevando para um total de 335 espécies conhecidas de Heteroptera. São ainda referidos 64 novos registos em Ilhas e algumas localidades adicionais para espécies já referidas anteriormente.

INTRODUCTION

As it was intended and expected by the authors, the publication of "A preliminary catalog of the Heteroptera of the Canary islands" (HEISS & BAEZ, 1990) stimulated discussions, research and further studies on the interesting island fauna. As a result a first addition was published recently (HEISS & RIBES, 1992).

New accumulated data, mainly based on material collected by Dutch entomologists and which is housed in the collection of the Zoologisch Museum Amsterdam, are presented now in a second addition.

Of the species listed so far, two more should be deleted from the list unless reconfirmation should be recorded:

Sigara (Vermicorixa) scripta (RAMBUR, 1842) = misidentification

Eurygaster hottentota (FABRICIUS, 1775) = unconfirmed old record

* Entom. Research Group, Tiroler Landesmuseum, Josef Schraffl-Strasse 2A, A-6020 Innsbruck, Austria

** Zoologisch Museum, Universiteit van Amsterdam, Afd. Entomologie Plantage Middenlaan 64, 1018 DH Amsterdam, The Netherlands

The indication of 1/1 refers to the number of male/female specimens investigated.

Acknowledgments: For presenting their interesting material we thank K. G. BERNHARDT (Osnabrück), J. P. DUFFELS, A. C. & W. N. ELLIS and J. A. W. LUCAS (all Amsterdam). M. BAENA (Cordoba) provided additional informations and P. MOULET (Avignon), J. PÉRICART (Montereau) and J. RIBES (Barcelona) kindly confirmed the identification of unclear species for which we thank them very much.

RECORDS NEW TO THE CANARY ARCHIPELAGO

Fam. Coreidae

Subfam. Coreinae

Gonocerus juniperi (HERRICH-SCHAEFFER, 1839)

1[♂] - Aguamansa 1200m, 1/1 on *Juniperus cedrus* WEBB. & BERTH. together with *Holcogaster longicornis* 21 - 27 Nov. 1992 EH.

Compared with material from Central Europe, the Canarian specimens differ only by smaller size (vid. MOULET).

Prionotylus brevicornis (MULSANT & REY, 1852)

C - El Baranquillo Andrés 6km WSW Los Cercados, 0/1 28 March 1987, ZMA

Fam. Alydidae

Nemausus simplex HORVATH, 1910

F - Corralejo, 1/0 12 - 18 March 1990, leg. ELLIS ZMA

L - Tinajo, 1/0 7 Feb. 1979, ZMA

Eremian species known from Egypt, Arabia

Fam. Pentatomidae

Piezodorus teretipes (STAL, 1864) = *P. onoidis* LINDBERG, 1932 (BAENA 1994)

L - 3 km N Maguez, 1/0 9 March 1977, leg. KRUSEMAN ZMA

The specimen is conspecific with reference material from Saudi Arabia identified by LINNAVUORI (LINNAVUORI, 1986).

Eremian species with a wide distribution in Northern - and West Africa. Pronotum and paramere figured by LINNAVUORI, 1982 including a key to West African species.

P. teretipes is much smaller than *P. punctipes* PUT., the second species of this genus occurring on Canary Islands. Furthermore it can be distinguished by less dense and more shallow punctures on head, pronotum, abdomen and hemelytra, by posteroexterior angles of dorsal laterotergites not pointed and black but unicolorous, by relatively longer antennal segment II and the shape of the pygophore (see Figs. 1-6).
